

Controller Use Of Flight Plan

Note: Flight strips are flight plans sent by the aircraft

As a controller, it is your responsibility to pass flight strip information along to the next controller. If you are the only controller on the network, then this does not apply, you will receive the flight strip (plan) and use it without having to pass it along.

When the time comes when you have to hand an aircraft off to the next position, you must give the next controller the flight plan. You can do this over Discord, by opening a DM conversation with the next controller and passing the flight plan into the DM and send it, you do not need a response but you may get one depending on traffic load.

Clearance Delivery, or what ever position is covering Clearance Delivery takes full responsibility for the flight strips. They will receive them upon initial contact with the aircraft and is responsible for getting them on to the next controller correctly with no amendments having to be made.

You may amend the flight strip if you feel the need to do so.
